I'm trying to update it, but the problem I'm running into is the design is so fragmented. There are hundreds of classes and I'm not sure how to go about updating the design without breaking any of it. What would be the best practice of updating a VB.Net to PHP? A: I'm not sure of the whole story of the situation, but from what you've described, your former developer may have made one or more of the following: Added lots of new classes and methods (or lots of existing classes and methods) Changed the signatures of existing methods Over- or under-used method names Changed the names of existing classes, and/or other things If you find that you need to add methods to existing classes, then you'll need to alter the existing classes. This will be the case whether the former developer made changes to existing classes or not. If the classes were renamed (and, if you're using code that's generated in some fashion, 5b5f913d15
